

Haiken

Brunel by Haiken

Flexible & carefree locker solutions

Brunel by Haiken offers a premium and user-friendly electronic locking system for lockers. The electronic locking system, together with the Software as a Service model (SaaS), forms a very user-friendly and intuitive high-tech platform for both employees and administrators of locker systems aimed at making business operations as efficient as possible. Security is guaranteed with functionalities of the Microsoft Azure cloud platform.

Locker management

Cloud-based

SAAS-Model

System Integrated

Customised Solution for every locker system

The electronic locking system, together with the Software as a Service model (SaaS), forms a safe and flexible solution which is characterized by more independence for the employee and unburdening the administrator. With the LoQit app, the employee can easily link his or her account and pay for the use of the locker. Security is guaranteed with functionalities of the Microsoft Azure cloud platform. If desired, you can purchase locker management as a service and link or integrate the locker management system with existing systems.

Locker management

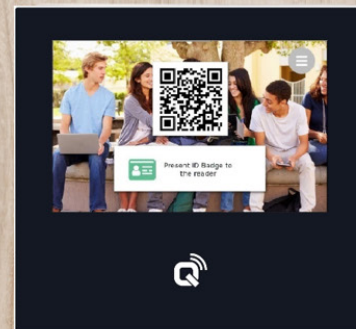

To keep the management burden of the administrator as low as possible, LoQit has been developed on the pillars of 'Self-Management'. The manager is given a more monitoring task. The settings for use can be adjusted remotely. In addition, the manager has realtime insight into locker use, the condition of the system and any malfunctions.

Easy control and use with Self-Management

The employee becomes more independent with regard to managing and using his or her locker. With the LoQit app, the user can, for example, easily link cards to his or her account and pay for the use of the locker (and possibly also other applications such as the coffee machine or copier).

Software as SAAS model

Do you wish to be completely unburdened in the field of ICT? With Brunel by Haiken you have the option to purchase the complete locker management as a service. Yoursystems are always up to date in terms of security and functionality. Moreover, you can easily scale up and add functionalities.

Cloud-based

Haiken guarantees security by using all functionalities within the Microsoft Azure cloud platform. The user information is stored within the Microsoft Azure environment according to the GDPR (AVG) guidelines. The Azure datacenters are:

- ISO 27001/27002 certified for information security
- SOC1/SOC2 and SSAE 16/ISAE 3402 certified

All data traffic that takes place between the lockers and the Locker Management Software is sent via HTTPS(TLS) encryption.

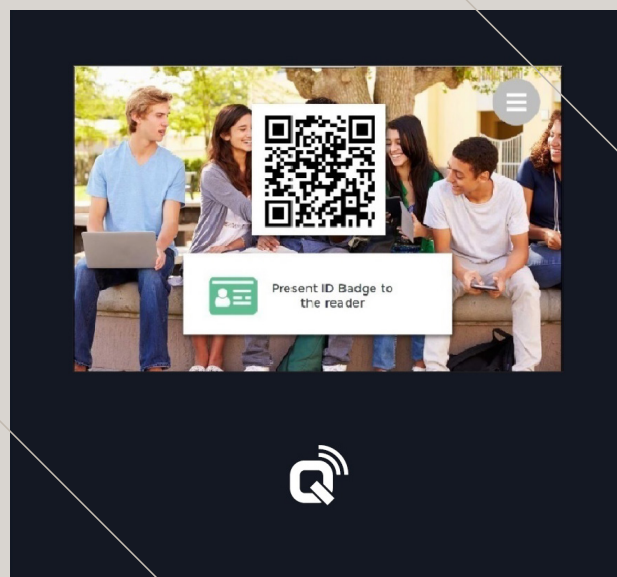

Efficient and flexible system integration

Haiken is always looking for the best solution. You may already be using, for example, a security, smartbuilding, HR or facility management system. The flexibility of the Brunel by Haiken locker management system makes it possible to easily link or even integrate with your existing systems.

The goal: to create the most efficient possible working method for all employees and users.

Cutting edge technology

The user terminal has a modern appearance and contains cutting-edge technology. It offers great support for advanced communication with the locker users. The screen can provide instructions and useful information. It can be equipped with additional technologies to identify the users of the lockers, like biometric finger print readers. The system is designed to make sure the user is in control.

Health Care

Seamless connection with the way of working within Health Care

The Brunel by Haiken electronic locking system is very suitable for use in health care. Through many years of experience, we have succeeded in developing a locking system that seamlessly connects to the way of working within hospitals and healthcare institutions. With the 'push to open' function the lockers are easy to clean and keep clean. You can set time restrictions which guarantees the availability of lockers for the next shift at all times. We ensure that your employees can do their work while their valuables are safely stored.

Easily set time restrictions to guarantee availability of lockers

Can be integrated with other software systems

With 'push to open' easy to clean and keep clean

Charge a smartphone inside the locker

Open lockers with a mobile device, card, PIN code, tag or finger scan

Integrated LED lighting
